## 27         9.0  69.00
## 28        13.0  70.00
```

```
# 1.c Find the mean of shoe size and height of the respondents.
# Mean of Shoe Size
mean_shoe_size <- mean(Data_Frame$Shoe_Size)
mean_shoe_size
```

```
## [1] 9.410714
```

```
# Mean of Height
mean_height <- mean(Data_Frame$Height)
mean_height
```

```
## [1] 68.58036
```

```
# 1.d Is there a relationship between shoe size and height? Why?
# NO...
```

```

# 2. Construct character vector months to a factor with factor() and assign the result to factor_months.
# Create the character vector for months
months_vector <- c("March", "April", "January", "November", "January", "September", "October", "September")
# Convert months_vector to a factor
factor_months_vector <- factor(months_vector)
# Print the factor version
print(factor_months_vector)

```

```

## [1] March    April     January  November January  September October
## [8] September November August   January  November November  February
## [15] May       August    July     December August   August   September
## [22] November February April
## 11 Levels: April August December February January July March May ... September

```

```

# Print levels of the factor
levels(factor_months_vector)

```

```

## [1] "April"    "August"    "December"  "February"  "January"   "July"
## [7] "March"    "May"       "November"  "October"   "September"

```

```

#3. Then check the summary() of the months_vector and factor_months_vector. / Interpret the results of the summary.
# Get summary of the original character vector
summary(months_vector)

```

```

##      Length      Class      Mode
##      24 character character

```

```

# Get summary of the factor vector
summary(factor_months_vector)

```

```

##      April    August  December  February  January    July    March    May
##          2         4         1         2         3         1         1         1
## November  October  September
##          5         1         3

```

```

# 4. Create a vector and factor for the table below.
# Create the character vector for directions
directions_vector <- c("East", "West", "North", "West", "West", "West", "North", "North")

# Convert it to a factor with a specified order of levels
factor_directions_vector <- factor(directions_vector, levels = c("East", "West", "North"))

# Print the factor vector with the specified order of levels
print(factor_directions_vector)

```

```

## [1] East West North West West West North North
## Levels: East West North

```

```
# 5. 5. Enter the data below in Excel with file name = import_march.csv
read.table(file = "import_march.csv", header=TRUE, sep=",")
```

```
##   Students Strategy.1 Strategy.2 Strategy.3 X

## 7                NA          NA          NA NA
```

## R Markdown

This is an R Markdown document. Markdown is a simple formatting syntax for authoring HTML, PDF, and MS Word documents. For more details on using R Markdown see <http://rmarkdown.rstudio.com>.

When you click the **Knit** button a document will be generated that includes both content as well as the output of any embedded R code chunks within the document. You can embed an R code chunk like this:

```
summary(cars)
```

```
##      speed      dist
##  Min.   : 4.0    Min.   : 2.00
## 1st Qu.:12.0    1st Qu.: 26.00
##  Median :15.0    Median : 36.00
##   Mean  :15.4    Mean   : 42.98
## 3rd Qu.:19.0    3rd Qu.: 56.00
##   Max.  :25.0    Max.   :120.00
```

## Including Plots

You can also embed plots, for example:

Note that the `echo = FALSE` parameter was added to the code chunk to prevent printing of the R code that generated the plot.
